

ENVI

CLINICAL SYSTEM INTEGRATION

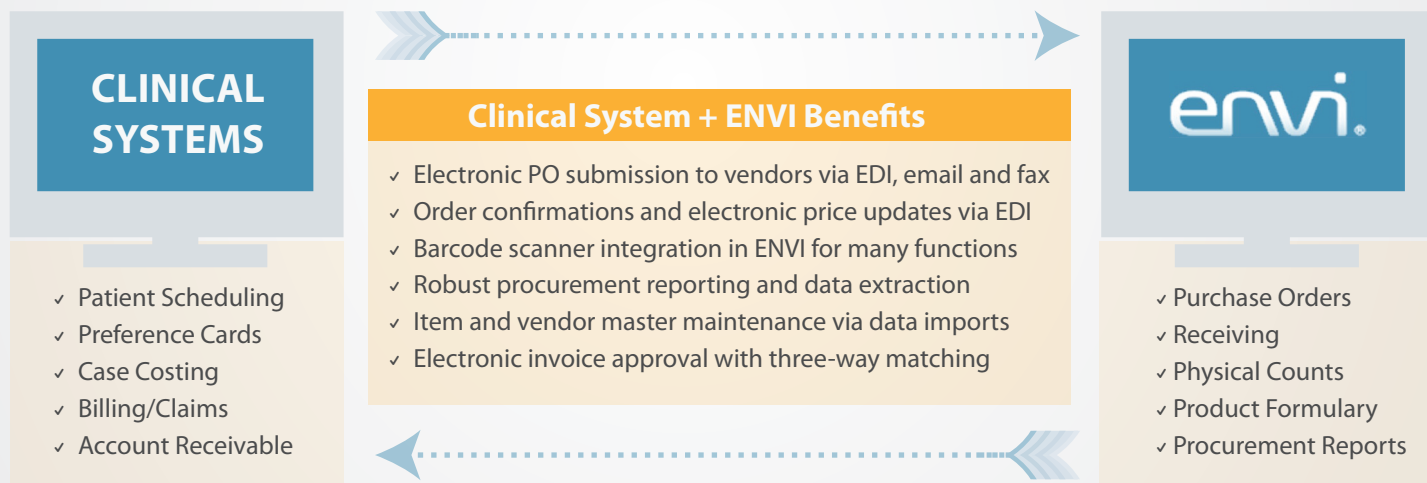

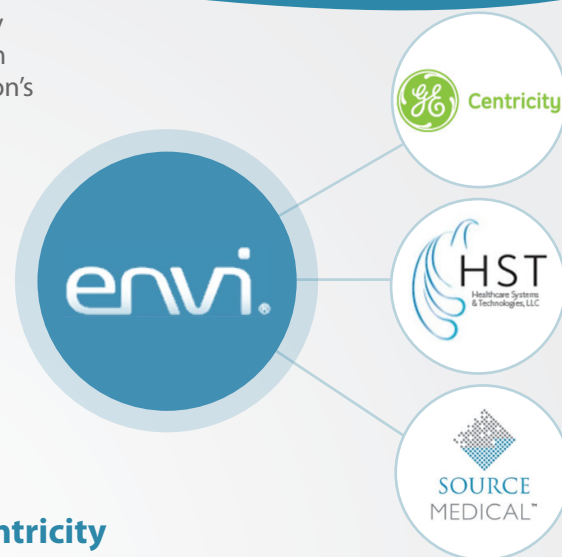

A healthcare provider's Clinical Information System (CIS) is the technology engine that drives operations and insures efficient clinical workflow. From patient scheduling to revenue cycle management, many of an organization's most vital functions rely on these highly specialized software suites.

The ENVI supply chain solution has been developed with a similar laser-focused approach to the non-acute healthcare market, but with the purpose of building a best-of-breed inventory control and purchasing management platform. ENVI not only offers all the benefits of a dedicated materials management information system (MMIS), but also supercharges the capabilities of your CIS by interfacing directly with your existing applications.

ENVI has been integrated with many industry leading Clinical Information Systems, a partial list includes:

HST • Vision • Athena • EPIC • AdvantX • Cerner • GE Centricity

Two technologies made better together

ENVI is not a replacement for your CIS, but a powerful companion application that will help streamline purchasing and inventory control processes while maximizing the value of your existing technology investment by taking in and passing along key data through a sophisticated interface engine.

Stream item/price data from ENVI into clinical systems

- ✓ Ensure accurate case costing analysis with the latest cost of goods
- ✓ Enable more current and complete preference card information

Perpetual inventory depletion (HST Pathways)

- ✓ Pass item decrements from HST to ENVI to track on-hand quantity based on the activity of clinical end-users
